Cognitive science is the interdisciplinary, scientific study of the mind and its processes. It examines the nature, the tasks, and the functions of cognition. Cognitive scientists study intelligence and behavior, with a focus on how nervous systems represent, process, and transform information.

In addition, cognitive science is an interdisciplinary, scientific study of the human reasoning, emotions, language, perception, attention, and memory. However, artificial intelligence (AI) is to explore the design of computers and software that would fit for intelligent behavior. The reconciliation of cognitive science and AI

~~Is Cognitive Science the Future of AI?~~

Overview. The module will study some of the major works in the history of modern philosophy of cognitive science and artificial intelligence. An indicative list of topics is the Turing test; the Chinese Room argument; the frame problem; connectionism; extended and embodied cognition; artificial consciousness. The approach will be philosophical and critical,

While scientists will use Cognitive science to replicate intelligence in AI, eventually AI will be using cognitive science to understand humans better. It will develop the ability to learn new things, make decisions by rationalizing and provide useful insights for human beings. The future is smart for AI and easier for us.

Cognitive Science is about making computers solve complex problems similar to how humans solve problems - it is the process that counts. So Cognitive Computing aims to mimic human reasoning behavior. Deep Blue is a great example to look at. In 1997, for the first time in history this IBM computer program beat the world chess champion, Gary Kasparov.
