The 1990s, appropriately termed "the decade of the brain," witnessed unprecedented advances in our knowledge of psychiatric neuroscience. Yet with every advance, we realized afresh that we were still in the beginning stages of a much longer journey. This text chronicles the next step of that journey. Structured around a proven teaching methodology that uniquely integrates the clinical aspects of psychiatric disorders with their neurobiology, this volume begins with two introductory chapters on functional neural circuitry and neural signaling pathways. The remaining six chapters present current knowledge on the neuroanatomic and neurochemical mechanisms underlying schizophrenia, addiction, anxiety, depression, bipolar disorder, and dementia/Alzheimer's disease. For clarity and consistency, each chapter features the same four divisions -- clinical presentation, neural circuitry, signaling pathways, and psychopharmacology -- as they relate to Schizophrenia, which reviews studies of the neural basis of schizophrenia and describes how the cortex, the thalamus, the basal ganglia, and the medial temporal lobe work together during normal brain function and then how each is perturbed in psychosis. Addiction, which focuses on the consequences of psychoactive substance use, including compulsive practices (e.g., eating, sex, Internet browsing) that might also involve the same brain circuits and signaling pathways. Of exceptional value are two unique illustrations that capture -- for the first time -- much of what we know about the anatomy and neurochemistry underlying the behavioral symptoms of addiction. Anxiety, which presents current hypotheses regarding neurocircuitry and signaling pathways for the three best-studied (from a neurobiologic perspective) anxiety disorders: panic disorder, posttraumatic stress disorder, and obsessive-compulsive disorder. Depression, which offers evidence for the involvement of highly interconnected cortical and limbic structures such as the prefrontal cortex, medial thalamus, amygdala, ventral striatum, hippocampus, and the hypothalamic-pituitary-adrenal axis in unipolar major depression, and suggests target areas (such as the cAMP pathway) for study in the development of new antidepressants. Bipolar disorder, which shows that specific abnormalities in signal transduction pathways, including protein kinase activity, G protein levels, and gene expression, are unique to bipolar patients, concluding that the actions of lithium and anticonvulsants on intracellular signaling pathways provide a new paradigm for novel pharmacological interventions. Dementia and Alzheimer's disease, which details current findings on neurofibrillary degeneration, relevant genes and proteins, pathogenesis (metabolic decline, defective cell repair, and A β toxicity), and treatment strategies (neurotransmitter replacement, and neuroprotective and regenerative approaches). Discusses frontotemporal dementia, dementia with Lewy bodies, Parkinson's disease, and vascular dementia. Meticulously researched and clearly written by 15 contributors -- all recognized experts from leading research and teaching institutions in the United States -- this compact and extensively illustrated volume stands out in the literature because it combines readability and practicality with the breadth and depth typically found only in far lengthier works. Psychiatric practitioners, residents, and students alike will welcome this informative, easy-to-read text, which will also be of special interest to mental health and pharmaceutical industry professionals, and of general interest to anyone who wants to know more about the biology of psychiatric illness.

Psychoneuroimmunology has emerged as a discipline advancing our knowledge of the relationships among psychosocial factors, the central nervous system, the immune system, and disease. The growing volume of evidence suggests that psychological states, including exposure to stressors and the presence of depressive states, may influence health and disease by altering immunologic states. Psychoneuroimmunology, a collaborative work of 50 international experts, expands on the American Psychiatric Association's symposium on this topic to present never-before-compiled scientific research from this evolving field. Maintaining a clinical focus, this book illustrates clinical effects by examining relevant research studies and models including Psychoneuroimmunological factors involved in specific illnesses such as cervical cancer, breast cancer and HIV/AIDS The role psychoneuroimmunology plays in carcinogenesis and the progression of established tumors, as well as findings on the progression of cancer that have general clinical relevance The effects of specific psychotropic medications; the effects of life stressors, bereavement, and social support; the response to those stressors; and stress management and psychosocial predictors of disease The impacts of gender-specific factors, diurnal variation, and behavioral genetics on the immune function The Stressor-Support-Coping model, which integrates existing psychoneuroimmunology findings and lays the groundwork for use in support group intervention This book is a first step toward organizing psychoneuroimmunology findings into coherent theoretical models and concludes with a look at future clinical applications. Complete with charts, references, and a detailed index, it is the most comprehensive source on psychoneuroimmunology.

This nineteenth volume of Advances in Clinical Child Psychology continues our tradition of examining a broad range of topics and issues that charac terizes the continually evolving field of clinical child psychology. Over the years, the series has served to identify important, exciting, and timely new developments in the field and to provide scholarly and in-depth reviews of current thought and practices. The present volume is no exception. In the opening chapter, Sue Campbell explores developmental path ways associated with serious behavior problems in preschool children. Specifically, she notes that about half of preschool children identified with aggression and problems of impulse control persist in their deviance across development. The other half do not. What accounts for these differ ent developmental outcomes? Campbell invokes developmental and fam ily influences as possible sources of these differential outcomes and, in doing so, describes aspects of her own programmatic research program that has greatly enriched our understanding of this complex topic. In a similar vein, Sara Mattis and Tom Ollendick undertake a develop mental analysis of panic in children and adolescents in Chapter 2. In recent years, separation anxiety and/ or experiences in separation from attach ment figures in childhood have been hypothesized as playing a critical role in the development of panic. This chapter presents relevant findings in the areas of childhood temperament and attachment, in addition to experi ences of separation, that might predispose a child to development of panic.
