Space Vector Pulse Width Modulation (SV-PWM) is a modulation scheme used to apply a given voltage vector to a three-phased electric motor (permanent magnet or induction machine). The goal is to use a steady state DC-voltage and by the means of six switches (e.g. transistors) emulate a three-phased sinusoidal waveform where the frequency and amplitude is adjustable.

DESIGN AND SIMULATION OF THREE PHASE RECTIFIER WITH POWER ...

The convention is that since there are 6 switches and 3 phases, each phase is either 0 as low-side switch is on, and 1 as high-side switch is on. So the states of the switches can be represented as 3 bit binary code $[S_a, S_b, S_c] = \dots$ and so on. There are many tutorials that covers this process.
